TITLE OF THE INVENTION

INTERNET ACCESS SYSTEM AND TELEPHONE DIRECTORY

CROSS-REFERENCE TO RELATED APPLICATIONS

5 This application is based upon and claims the  
benefit of priority from the prior Japanese Patent  
Application No. 2000-307874, filed October 6, 2000, the  
entire contents of which are incorporated herein by  
reference.

BACKGROUND OF THE INVENTION

10 The present invention relates to a convenient  
Internet access system and a convenient telephone  
directory.

15 In the prior art, home pages or mail addresses on  
the Internet domain are accessed by inputting Internet  
domain access addresses, or URL (Uniform Resource  
Locator) addresses, which comprise complex English  
string code sequences.

20 When one accesses an information apparatus, a  
communication apparatus or an information terminal of  
some company or some party at the other end using the  
URL address, he/she has to know the domain (URL) name.  
Even if a directory search engine is used, it is  
inconvenient to find the domain name unless the genre  
to which a party at the other end belongs. If one  
25 wishes to access a party at the other end on the basis  
of some particle, etc. without an URL, he/she cannot  
access it.

BRIEF SUMMARY OF THE INVENTION

The object of the present invention is to provide an Internet access system enabling a user to easily access a specific resource only on the basis of a telephone number, and to provide a telephone directly therefor.

The subject matter of the invention relates to a system for acquiring an Internet domain address by inputting a telephone number, thus accessing an information apparatus, a communication apparatus or an information terminal at the other end.

According to an aspect of the invention, there is provided an Internet access system comprising: an address acquisition section for acquiring a telephone number and identification information produced by adding, to the telephone number, address presence/absence specifying information indicating at least presence/absence of an Internet domain address for identifying a resource on the Internet, and acquiring an Internet domain address associated with the identification information from a database in which at least telephone numbers and Internet domain addresses are associated; and an address transmission section for sending the Internet domain address to a user terminal, and prompting the user terminal to access a resource specified by the Internet domain address.

09713169 "14500

According to another aspect of the invention,  
there is provided an Internet access system wherein  
input data is analyzed to acquire at least one of  
correspondency information between a telephone number  
5 and an Internet domain address associated with the  
telephone number, correspondency information between a  
telephone number and attribute information associated  
with the telephone number, and correspondency  
information between an Internet domain address and  
10 attribute information associated with the Internet  
domain address.

According to still another aspect of the invention,  
there is provided a telephone directory comprising: a  
telephone number display section for associatively  
15 displaying a telephone number and discrimination  
information for discriminating whether there is a URL  
address associated with the telephone number.

The invention relating the system is applicable to  
a method using this system.

20 The invention relating to the system or the method  
is applicable to a computer-readable recording medium  
storing a program for enabling a computer to execute a  
procedure corresponding to the invention (or a program  
for causing a computer to function as means corre-  
25 sponding to the invention or causing a computer to  
realize a function corresponding to the invention).

Additional objects and advantages of the invention

0913159 "11500  
00577" 6977260

will be set forth in the description which follows, and in part will be obvious from the description, or may be learned by practice of the invention. The objects and advantages of the invention may be realized and  
5 obtained by means of the instrumentalities and combinations particularly pointed out hereinafter.

BRIEF DESCRIPTION OF THE SEVERAL VIEWS OF THE DRAWING

The accompanying drawings, which are incorporated in and constitute a part of the specification,  
10 illustrate presently preferred embodiments of the invention, and together with the general description given above and the detailed description of the preferred embodiments given below, serve to explain the principles of the invention.

15 FIG. 1A and FIG. 1B show whole structures of an Internet access system according to one embodiment of the present invention;

FIG. 2 shows detailed structures of a server and a handheld information terminal according to the  
20 embodiment;

FIG. 3 is a flow chart illustrating an Internet access procedure according to the embodiment;

FIG. 4A shows an example of display on an URL address select screen according to the embodiment;

25 FIG. 4B shows an example of an Internet domain address input screen;

FIG. 5 shows an example of a displayed telephone

09743459.11500

number list of a telephone directory in a case of using the Internet access system according to the embodiment; and

FIG. 6 shows an example of the handheld information terminal according to the embodiment.

#### DETAILED DESCRIPTION OF THE INVENTION

An embodiment of the present invention will now be described with reference to the accompanying drawings.

FIGS. 1A and 1B show whole structures of an Internet access system according to one embodiment of the present invention.

As is shown in FIG. 1A, a server 1, which manages the Internet access system, and a plurality of handheld information terminals 2 are connected to the Internet 3. The connection to the Internet 3 may be in a wired mode or a radio (wireless, optical transmission, etc.) mode.

FIG. 2 shows detailed structures of the server 1 and handheld information terminal 2. As is shown in FIG. 2, the server 1 has an interface 11 for transmission/reception of information with the Internet 3. A telephone number/URL address correspondence analysis program 12, a telephone number search/collection program 13 and an URL address search/collection program 14 are connected to the interface 11. The telephone number/URL address correspondence analysis program 12 functions to analyze an URL address in response to a request from the

0057169 "11500

handheld information terminal 2. The telephone number  
search/collection program 13 functions to search and  
collect a telephone number and attribute information  
associated with the telephone number from the terminal,  
5 etc. connected to the Internet 3. The URL address  
search/collection program 14 functions to search and  
collect a URL address and attribute information  
associated with the URL address from the terminal, etc.  
connected to the Internet 3. The attribute information  
10 in this context includes all kinds of attribute  
information capable of identifying users of telephone  
numbers, such as the names of persons, companies or  
organizations, jobs, general concepts of hobbies,  
interests, fields of study, etc., as well as categories,  
15 addresses, places, or temporal information such as time  
and dates.

A telephone number/attribute correspondence  
database 16 in which telephone numbers and attribute  
information are associated and stored is connected to  
20 the telephone number search/collection program 13 and  
the telephone number/URL address correspondence  
analysis program 12. A telephone number/URL address  
correspondence database 15 in which telephone numbers  
and URL addresses are associated and stored is  
25 connected to the telephone number/URL address  
correspondence analysis program 12. A URL address/  
attribute correspondence database 17 in which URL

addresses and attribute information are associated and stored is connected to the telephone number/URL address correspondence analysis program 12 and the URL address search/collection program 14.

5           The handheld information terminal 2 comprises an interface 23 for transmission/reception of information with the Internet 3, a terminal database 24, a search/storage program 21 and an information output section 22. The terminal database 24 stores  
10           information input by the user, information sent from the server 1, and information processed by the search/storage program 21. The search/storage program 21 is connected to the terminal database 24 and functions to store various information in the terminal  
15           database 24 and to request an access, via the Internet 3, to other terminals including the server 1 connected to the Internet 3. The information output section 22 is connected to the search/storage program 21. The information output section 22 displays information sent  
20           from the server 1, information input by the user, and various information processed by the search/storage program 21. The information output section 22 may output character information or voice information. Accordingly, voice information or character information  
25           may be input to input means (not shown) of the handheld information terminal 2.

Methods of constructing the databases 15 to 17 in

the server 1 will now be described.

To begin with, the method of constructing the telephone number/attribute correspondence database 16 will be described.

5           On the basis of attribute information relating to a given person or company (hereinafter referred to as "to-be-registered party"), the telephone number search/collection program 13 searches countless terminals, etc. connected to the Internet 3 and finds  
10           telephone numbers associated with the attribute information. For example, if a search is carried out on the basis of the attribute information of a person A (assuming that the attribute information is the name of person A) using ordinary search engines, WEB (World  
15           Wide Web) pages on which the name of person A appears can be extracted. Then, the telephone number of the person A is found from among the extracted WEB pages. A WEB page contains a plurality of character  
20           information units. Based on the number of numerals constituting a telephone number, telephone number candidates can be extracted from the character  
25           information units. Specifically, if the telephone number comprises 10 numerals, character information units each having 10 successive numerals are extracted. Of course, since there may be character information units including hyphens "-" among numerals indicating telephone numbers, it is preferable to extract such

character information units, too. Moreover, the  
telephone number search/collection program 13  
determines whether the extracted telephone number  
relates to the person A. Where contents of WEB pages,  
5 e.g. tags expressed in XML (eXtensible Markup Language)  
format, are successively searched, if there is  
information indicative of a telephone number and the  
name of person A in a tag set, it is determined that  
this telephone number identifies person A. Needless to  
10 say, the concept of "tag set" includes not only a  
single tag indicative of one attribute but also a set  
of tags which are separate but indicative one attribute.

The method of constructing the URL address/  
attribute correspondence database 17 is basically  
15 similar to that of constructing the telephone  
number/attribute correspondence database 16, except  
that the telephone number is replaced with an URL  
address. The database 17 is constructed by the URL  
address search/collection program 14. Of course, since  
20 the URL address of a WEB page containing attribute  
information can be distinguished from other information,  
there is no need to perform such a procedure, as  
described above, for extracting a telephone number on  
the basis of the number of numerals.

25 In the above-described methods of constructing the  
telephone number/attribute correspondence database 16  
and URL address/attribute correspondence database URL

17, where the search/collection programs 13 and 14 cannot determine whether the attribute information contained in the WEB page relates to the telephone number of URL address of person A but the WEB page contains such a telephone number of URL address, the operator may display the WEB page (not shown) and check the display content. In this case, since the attribute information of person A can be displayed so as to be distinguishable from other information, the operator can easily find the attribute information of person A.

The method of constructing the telephone number/URL address correspondence database 15 will now be described. At least three methods are available in constructing the telephone number/URL address correspondence database 15.

A first method is used where either the URL address or the telephone number of the to-be-registered party is given in advance. Specifically, one of the URL address and the telephone number, which is not given in advance but is to be found, is extracted from countless WEB pages accessible via the Internet 3. This method is substantially the same as the method of constructing the telephone number/attribute correspondence database 16 or URL address/attribute correspondence database 17.

In a second method, common attribute information between the telephone number/attribute correspondence

0057469.44500

database 16 and URL address/attribute correspondence  
database 17 is extracted. The telephone number and  
URL address associated with the common attribute  
information are acquired, and the acquired results are  
5 registered in the telephone number/URL address  
correspondence database 15.

In a third method, registration is effected by the  
input from the user. Specifically, if the user inputs  
through the handheld information terminal 2 the  
10 telephone number and URL address relating to the to-be-  
registered party having some attribute information, the  
input information is directly registered in the  
telephone number/URL address correspondence database 15.

Where the registration is performed by the third  
15 method, the user can request registration with plural  
URL addresses associated. For example, the URL address  
of the headquarters of some company and the URL address  
of a branch office of this company may be associated in  
the registration (hereinafter such associatively  
20 registered plural URL addresses are referred to as "URL  
address set"). In this case, in addition, the  
telephone number may be associated in accordance with  
the hierarchical order of URL addresses. That is, the  
top page of the URL address may be associated with a  
25 given page accessible from this top page. For example,  
where the URL address "http://www.ir.ct.com" of a  
certain top page is associated with the telephone

00577" 597E7250

number "03-3000-0000" in registration, the URL address  
"http://www.ir.ct.com/es" which is lower in order than  
the URL address of the top page may be associated with  
the telephone number "03-3000-0000-001" which is formed  
5 by adding information "001" indicative of a lower-order  
URL address to the end of the telephone number  
"03-3000-0000".

An Internet access method using the thus  
constructed databases 15 to 17 will now be described  
10 with reference to a flow chart of FIG. 3.

The user accesses the Internet 3, using the  
handheld information terminal 2, and requests access to  
the server 1 which manages the Internet access system  
of the present invention (s1). Upon receiving the  
15 request, the server 1 causes the information output  
section 22 of handheld information terminal 2 to  
display a telephone number input screen, thus prompting  
input of the telephone number (s2). The user inputs  
the telephone number relating to, e.g. the desired  
20 access, through the displayed input screen. As regards  
the method of input, numerical characters may be input  
one by one, or the terminal database 24 may be searched  
to extract the already registered telephone number.  
The thus input telephone number is sent to the server 1  
25 (s3). The telephone number/URL address correspondency  
analysis program 12 extracts, from the telephone  
number/URL address correspondency database 15, the URL

FIG. 4A shows an example of display on the URL address select screen. The user confirms the display on the information output section 22 of handheld information terminal 2 and selects the desired URL address. The operation for selection may be freely selective. For example, the cursor is moved on the screen displayed on the information output section 22, using the input means (not shown) provided on the handheld information terminal 2, and presses a decision button when the cursor has reached the desired URL address. For example, new registration buttons 41 and 42 may be provided using the URL address select screen, and new registration of a company or a person may be prompted. The information selected by the user is sent to the server 1 (s6). The telephone number/URL address correspondence analysis program 12 extracts the URL address associated with the obtained select information from the database 15, sends the URL address to the handheld information terminal 2 and causes the information output section 2 to display a confirmation screen including this URL address (s7). The confirmation screen may be the same as the URL address select screen shown in FIG. 4A. In this case, a URL

FIG. 5 shows an example of a telephone number display list of a telephone directory in a case where the Internet access system with the above structure is used. Where the system is constructed as described above, it is easily understood, as is shown in FIG. 5, that a telephone number with identification information "\*" at the top thereof, among telephone numbers listed in the telephone directory, is not merely a telephone number for requesting a call, but a telephone number associated with an URL address. Moreover, the identification information "\*" actually indicates an URL address which can be accessed by inputting the telephone number with this identification information.

FIG. 5 shows an example of a telephone number display list of a telephone directory in a case where the Internet access system with the above structure is used. Where the system is constructed as described above, it is easily understood, as is shown in FIG. 5, that a telephone number with identification information "\*" at the top thereof, among telephone numbers listed in the telephone directory, is not merely a telephone number for requesting a call, but a telephone number associated with an URL address. Moreover, the identification information "\*" actually indicates an URL address which can be accessed by inputting the telephone number with this identification information.

Accordingly, this telephone directory has both the function of a telephone directory listing telephone numbers and the function of a URL address list. As a result, there is no need to prepare a URL address directory in addition to a telephone directory. Of course, for editors of telephone number directories, there is no need to provide a URL address column to the telephone directory, or a list for URL addresses. By adding the identification information "\*" to the currently available telephone directory, this telephone directory may be sold as an URL address directory. Needless to say, such a telephone directory may be printed on paper or displayed on information display means such as a CRT of a computer.

As has been described above, according to the embodiment of the invention, the user can access a desired resource (e.g. a desired terminal) without inputting a URL address, which is troublesome and time-consuming. Furthermore, since the already available telephone number is used as the identification information for identifying the party to be called, the identification information for identifying the party to be accessed can be acquired without producing identification information independently in addition to the already available identification information. It should suffice if digital identification information indicating whether there is registration of URL address

is newly added to the already available information.  
Even a user who does not know a certain URL address  
itself can search for the URL address by the programs  
12 to 14 on the basis of attribute information  
5 specifying a resource to be accessed, only if he/she  
knows such attribute information. Thus, the user can  
access the desired resource on the basis of the  
attribute information alone. In a case of a terminal  
in which software for inputting Chinese characters is  
10 not installed, an Internet domain address including a  
Chinese character cannot be input. However, according  
to the present invention, there arises no problem if  
symbol "\*" can be input as identification information,  
other than numerals or Chinese characters. Thus, it is  
15 not necessary that the terminal be equipped with  
Chinese character inputting software.

The present invention is not limited to the above  
embodiment. In the above embodiment, the server 1 and  
handheld information terminal 2 are employed by way of  
20 example. However, as shown in FIG. 1B, the handheld  
information terminal 2 may be replaced with a desktop  
terminal 4. In the above embodiment, the URL address  
is used as the Internet domain address. However, it is  
possible to use, in addition to the URL address, any  
25 resource specifying information (e.g. Internet domain  
address) for distinguishing one resource from another,  
which is connected to the network.

Where the present invention is applied to the desktop terminal 4, etc. having a keyboard capable of inputting characters by pressing the associated keys which correspond to alphabet and numerals in one-to-one  
5 correspondence, it is possible to input characters to an Internet domain address input section (address bar) on a telephone number input screen. In this case, both the ordinary Internet domain address and the telephone number can be input to the Internet domain address  
10 input section. Thus, software for distinguishing addresses and telephone numbers is used. FIG. 4B shows an example of the Internet domain address input screen including an address bar 401. This software performs morphological analysis and/or syntactic analysis of  
15 characters input to the address bar 401. Preferably, where the input characters begin with "http", they are determined to indicate an Internet domain address. Otherwise, the input characters are determined to indicate a telephone number. Where the Internet domain  
20 address has been input, the software may cause the telephone number/URL address correspondence analysis program 12 to extract, from the telephone number/URL address correspondence database 15, the telephone number associated with the input address, and the  
25 obtained telephone number may be displayed on the screen. Thereby, the user can easily ask a question or make a complaint by dialing the obtained telephone

number with respect to the resource accessed based on the Internet domain address.

In the case of the desktop terminal 4, it is preferable to input a hyphenated telephone number. For example, telephone number "\*0123456789" is input as  
5        "\*012-345-6789". The telephone number including hyphens "-" is discriminated. However, even whether the terminal employed is the desktop terminal 4 or the handheld information terminal 2, and even whether the  
10       telephone number is hyphenated or not, the telephone number should preferably be identified.

The present embodiment is applicable to worldwide telephone numbers. Where the present system is commonly used worldwide, it is possible to add  
15       character information, such as alphabet or numerals, to the identification information "\*". For example, character information, such as "jpn" for Japan, "usa" for the U.S, or "chn" for China, may be added as country identification information for identifying  
20       countries. On the input screen described in connection with step (s2), the input of the telephone number may be prompted and the selection of the country associated with the request for access may also be prompted. In this case, the country associated with the request for  
25       access may be selected by selecting image information on national flags displayed on the input screen.

Although FIG. 3 shows the case of separately

00511" 591160

inputting and selecting the telephone number, the selection operation may be omitted and the URL address may be sent from the server 1 to the terminal 2 in response to the input of the telephone number. In addition, in the above embodiment, after the telephone number is selected, the URL address is sent and delivered to the information output section 22 of the terminal 2. For example, if the terminal 2 is set such that "http://www." is output on the URL address display section by pressing "\*" on the input screen, only the subsequent address may be input and quick access to the desired terminal, etc. is enabled. Besides, the terminal 2 may be set such that "co.jp/" or "co.jp/i/" may be displayed by pressing "#" on the input screen. FIG. 6 shows an example of the handheld information terminal 2 having a "\*" button 61 and a "#" button 62. With these settings, the user can access the desired terminal only by inputting "\*telephone number#". As a result, the presence of a home page can be emphasized and stressed on the telephone directory, etc. without incurring an excess cost.

In the above embodiment, the URL address and the telephone number for call are distinguished by adding to the telephone number the address presence/absence specifying information "\*" indicating that the URL address is associated with the telephone number. Needless to say, this invention is not limited to this

embodiment. Other identification information may be added as the address presence/absence specifying information in place of the above information "\*". The server 1 may function not only to provide the above WEB

5 page accessing services, but also to provide line connection services between information terminals in response to call requests. In this case, it is desirable to provide, between the interface 11 of server 1 and the programs 12 to 14, discrimination

10 means for discriminating the telephone number for call request and the telephone number for WEB page access. This discrimination means determines whether the telephone number sent from the information terminal includes URL address presence/absence specifying

15 information "\*". If it includes the URL address presence/absence specifying information "\*", it is determined that the access to the WEB page is requested, and the access connection service is provided by the operation according to the above-described embodiment.

20 If the telephone number sent from the information terminal does not include URL address presence/absence specifying information "\*", it is determined that a telephone call is requested, and the line connection for a call between information terminals is effected.

25 As has been described above in detail, according to the present invention, a resource (e.g. a desired terminal) can easily be accessed without inputting an

Internet domain address, which is troublesome and time-consuming.

Additional advantages and modifications will readily occur to those skilled in the art. Therefore,  
5 the invention in its broader aspects is not limited to the specific details and representative embodiments shown and described herein. Accordingly, various modifications may be made without departing from the spirit or scope of the general inventive concept as  
10 defined by the appended claims and their equivalents.

00577" 69760

WHAT IS CLAIMED IS:

1. An Internet access system comprising:  
an address acquisition section for acquiring an  
resource name for identifying a resource on the  
Internet associated with identification information  
from a database in which at least telephone numbers and  
resource names are associated, wherein said  
identification information includes telephone number  
and address presence/absence specifying information  
indicating at least presence/absence of an resource on  
the Internet; and

an access prompting section for prompting a user  
to access a resource specified by the resource name.

2. An Internet access system according to claim 1,  
wherein said database is generated by a search section  
for searching resources connected to the Internet,  
thereby producing correspondency data between the  
telephone number and the resource name.

3. An Internet access system according to claim 1,  
wherein said database is generated by searching  
resources connected to the Internet and finding, on the  
basis of the telephone number and attribute information  
associated with the telephone number, the resource name  
associated with the attribute information.

4. An Internet access system according to claim 1,  
wherein said database is generated by searching  
resources connected to the Internet and finding, on the

00577" 69737260

basis of the resource name and attribute information associated with the resource name, the telephone number associated with the attribute information.

5. An Internet access system wherein input data  
5 is analyzed to acquire at least one of correspondence information between a telephone number and an resource name for identifying a resource on the Internet associated with the telephone number, correspondence information between a telephone number and attribute  
10 information associated with the telephone number, and correspondence information between an resource name and attribute information associated with the resource name.

6. An Internet access system comprising:  
a first information processing section for  
15 analyzing input data, thereby acquiring correspondence information between a telephone number and first attribute information associated with the telephone number;

a second information processing section for  
20 analyzing input data, thereby acquiring correspondence information between a resource name for identifying a resource on the Internet and second attribute information associated with the resource name; and

an information registration section for collating  
25 the first attribute information acquired by the first information processing section and the second attribute information acquired by the second information

00511" 5977 260

processing section, and associatively registering,  
where both first and second attribute information  
coincides, the telephone number and the resource name  
which are associated with the first and second  
5 attribute information.

7. A telephone directory comprising:

a telephone number display section for  
associatively displaying a telephone number and  
discrimination information for discriminating whether  
10 there is a URL address associated with the telephone  
number.

00511597460

ABSTRACT OF THE DISCLOSURE

A telephone number sent from a handheld  
information terminal and identification information  
produced by adding, to the telephone number, address  
5 presence/absence specifying information indicating at  
least presence/absence of a URL address for identifying  
a resource on the Internet are acquired. A URL address  
associated with the identification information is  
acquired from a telephone number/URL address corre-  
10 spondency database in which at least telephone numbers  
and Internet domain addresses are associated. A  
telephone number/URL address correspondence analysis  
program functions to send the URL address to the  
handheld information terminal and to prompt the  
15 handheld information terminal to access the URL address.

## DECLARATION FOR PATENT APPLICATION

As a below named inventor, I declare:  
that I verily believe myself to be the original, first and sole (if only one  
individual inventor is listed below) or an original, first and joint inventor  
(if more than one individual inventor is listed below) of the invention in

## INTERNET ACCESS SYSTEM AND TELEPHONE DIRECTORY

the specification of which is attached hereto unless the following box is  
checked.

- ☐ was filed on \_\_\_\_\_ as United States Application  
or PCT International Application No. \_\_\_\_\_, and  
was amended on \_\_\_\_\_ (if applicable).

I hereby state that I have reviewed and understand the contents of the above  
identified specification, including the claims, as amended by any amendment  
referred to above.

I acknowledge the duty to disclose information of which is material to pat-  
entability as defined in 37 CFR 1.56.

I hereby claim foreign priority benefits under 35 U.S.C. 119(a)-(d) or 365  
(b) of any foreign application(s) for patent or inventor's certificate, or  
35 U.S.C. 365(a) of any PCT International application which designated at  
least one country other than the United States, listed below and have also  
identified below any foreign application for patent or inventor's certifi-  
cate, or PCT International application having a filing date before that of the  
application on which priority is claimed:

<u>Country</u>	<u>Category</u>	<u>Application No.</u>	<u>Filing Date</u>	<u>Priority Claim</u>
Japan	Patent	2000-307874	October 6, 2000	Yes

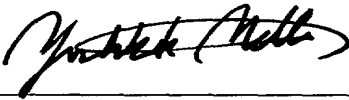

And I hereby appoint Alfred Stapler (Reg.No. 16,675), Anthony S.  
Volpe (Reg.No. 28,377), C. Frederick Koenig III (Reg.No. 29,662), Allan H.  
Fried (Reg.No. 31,253), Gerald B. Halt, Jr. (Reg.No. 37,633), Timothy J.  
Lubecki (Reg.No. 38,953) and Glenn M. Massina (Reg.No. 40,081), each of  
whose address is 400 One Penn Center, 1617 John F. Kennedy Boulevard,  
Philadelphia, PA 19103, or any one of them, my attorneys with full power  
of substitution and revocation, to prosecute this application and to  
transact all business in the Patent & Trademark Office connected there-  
with, and request that correspondence be directed to Volpe and Koenig,  
P.C., 400 One Penn Center, 1617 John F. Kennedy Boulevard, Philadelphia,  
PA 19103.

I declare further that all statements made herein of my own knowledge are  
true and that all statements made on information and belief are believed to  
be true; and further that these statements were made with the knowledge that  
willful false statements and the like so made are punishable by fine or im-  
prisonment, or both, under Section 1001 of Title 18 of the United States  
Code and that such willful false statements may jeopardize the validity of  
the application or any patent issued thereon.
